WEB LAB · FREE PACK

The AI Video *Workflow* Pack

One instruction file that any AI coding agent can follow to make a finished vertical Short: Claude Code (Opus or Sonnet), ChatGPT Codex, or a free model in OpenCode.

We built this process once with Claude Opus, then wrote every decision down. The expensive model plans once, and any model repeats the work.

What you get

A 30-40 second vertical video (1080x1920, 60 fps) about one topic:

- fact-checked, with every claim tied to a source;
- a narrator voice, one line at a time;
- real screenshots of the real thing, on screen as you talk about them;
- burned-in captions, music, and an end card in YOUR style;
- mastered to -14 LUFS, the loudness YouTube, TikTok and Instagram expect.

Tools (free unless marked paid)

Job	Tool
Animation and render	HyperFrames (`npx hyperframes`), which turns HTML into video
Video and audio work	FFmpeg
Captures of real pages	Playwright (Chromium)
Voice, paid	ElevenLabs v3
Voice, free	Kokoro (Apache-2.0, runs on your CPU)
Word timings for captions	faster-whisper (free)
Music, paid	ElevenLabs Music
Music, free	any track you own a licence for, or no music

The steps (do them in this order)

1. Facts first

Find the official sources: the vendor's own pages and docs. Confirm every claim, and write `fact-check.md` with four columns: claim, verdict, exact quote, URL. If you can't confirm a claim, cut it. Never invent a number, a quote or a feature.

2. Script (30-40 s)

- Line 1 is the hook. It contradicts a belief or reveals a result ("One of these videos cost zero dollars.").
- One idea per sentence, 6-8 sentences in total.
- Every number shown on screen is also spoken.
- The last line is the call to action, then "Follow [your channel]. And remember:", so the end loops back into line 1.

3. Voice

- One audio file per sentence.
- Never speed the voice up. Shorten long pauses instead.
- Give each line a short fade at the end, so it doesn't cut off hard.
- Time every word (faster-whisper with word timestamps). Captions and cards are timed to these words.

4. Real material

- Capture the real thing: official pages in dark mode, real product screens, a real output if you can make one.
- Use Playwright at 2-3x pixel density, so text stays sharp on a phone.
- Put every capture on one contact sheet and look at it before you use any of them.
- Never generate a fake screenshot of a product.

5. Build (in your own style)

Your AI builds the video from the `STYLE.md` you write below, not from anyone else's look. Without one, every video looks generic.

- Frame 0 must already be moving, with the hook on screen. Never fade in from black.
- Show one idea on screen at a time, changing on the spoken word.
- Keep the captions away from anything important.
- Duck the music under the voice.

6. Check (never skip this)

- The file is 1080x1920 at 60 fps, and audio and video end within 0.05 s of each other.
- Loudness is -14 LUFS, with the true peak at or below -1 dB.
- There are no black frames, no frozen stretch over 1 second, and no one-frame flashes.
- Take a snapshot at every card and look at each one: nothing clipped, empty or off the frame.

7. Deliver

`final.mp4`, a 720p preview, a contact sheet, and a cover image. Keep a `TIMELOG.md` of when each step started and finished, and what failed.

Your style (write this first)

Make a file called `STYLE.md` in your video folder and fill it in. This is what makes the videos yours. Add every correction you give the AI to this file.

```
# My video style
Colours:      ...
Fonts:        ...
Cards:        how screenshots and text sit on screen
Captions:     size, colour, words at a time
Pacing:       a new shot every ... seconds
Music + SFX:  style, how loud under the voice
End card:     my name / logo / call to action
Never:        ...
```

How to use the three packs

Pick the pack for the AI you use. Make a new folder for your video and put three files in it: `WORKFLOW.md` (this guide), your `STYLE.md`, and the pack's own file below, saved with the exact file name shown. Open the folder in your AI tool and paste the start prompt.

Pack 1 · Claude Code (Opus or Sonnet)

Save this as **`CLAUDE.md`** in your video folder.

````
# Short video workflow (Claude Code, Opus or Sonnet)

Read `WORKFLOW.md` in this folder before you do anything, and follow it step by step. It is the full process. The look comes from `STYLE.md` in this folder: follow it exactly, and if it is missing, ask me to fill it in before you build.

## How to work

- Use one folder per video. Keep `TIMELOG.md` up to date, with each step's start and end time and anything that failed.
- If a step can't be done, write it in `NOTES.md` and carry on with the next step.
- Run long renders in the foreground and wait for them to finish. Never leave a render running in the background and end your turn.
- Look at every contact sheet and snapshot yourself before you call a step done.
- Never post anything anywhere. Your job ends at the delivered files.

## Model tip
Sonnet is a good fit for the repeat work. Use Opus for the first run of a new format, or when a judgment call matters, like which facts to keep or which shot to use.

## Start prompt (paste this, and change the topic)
```
Read CLAUDE.md, WORKFLOW.md and STYLE.md first. TOPIC: <your topic>.
Do steps 1-7 of WORKFLOW.md in order. Stop after step 2 and show me the script before you build.
```
````

Pack 2 · ChatGPT Codex

Save this as **`AGENTS.md`** in your video folder.

````
# Short video workflow (ChatGPT Codex)

Read `WORKFLOW.md` in this folder before you do anything, and follow it step by
step. It is the full process. The look comes from `STYLE.md` in this folder:
follow it exactly, and if it is missing, ask me to fill it in before you build.

## How to work

- Use one folder per video. Keep `TIMELOG.md` up to date, with each step's start
and end time and anything that failed.
- If a step can't be done, write it in `NOTES.md` and carry on with the next step.
- Codex runs in a sandbox. Give it permission to run `npx`, `ffmpeg` and `python`
in this folder, and to reach the web for step 1 (facts) and step 4 (captures).
- Open and check every contact sheet and snapshot before you call a step done.
- Never post anything anywhere. Your job ends at the delivered files.

## Start prompt (paste this, and change the topic)
```
Read AGENTS.md, WORKFLOW.md and STYLE.md first. TOPIC: <your topic>.
Do steps 1-7 of WORKFLOW.md in order. Stop after step 2 and show me the script
before you build.
```
````

Pack 3 · OpenCode, free ($0)

Save this as `AGENTS.md` in your video folder.

````
# Short video workflow (OpenCode, $0)

Read `WORKFLOW.md` in this folder before you do anything, and follow it step by step. It is the full process. The look comes from `STYLE.md` in this folder: follow it exactly, and if it is missing, ask me to fill it in before you build.

## This run must cost $0

- **Model:** a free model in OpenCode. We used GLM 5.3. A model that can see images (a "VL" model) is better, because it can check its own frames.
- **Voice:** Kokoro (`pip install kokoro-onnx soundfile`, plus the free model files from github.com/thewh1teagle/kokoro-onnx releases). Never use a paid voice API.
- **Captions:** faster-whisper for word timings (`pip install faster-whisper`).
- **Music:** a track you own, or none at all. Never use a paid music API.
- **Cover:** set type in HTML over a frame from your video. No image generation.

## How to work

- Use one folder per video. Keep `TIMELOG.md` up to date, with each step's start and end time and anything that failed.
- Free models are slower, so plan for 2-3 hours. Work through it one step at a time, and save after each step.
- If a step can't be done, write it in `NOTES.md` and carry on with the next step.
- Never post anything anywhere. Your job ends at the delivered files.

## Start prompt (paste this, and change the topic)
```
Read AGENTS.md, WORKFLOW.md and STYLE.md first. This run must cost $0. TOPIC: <your topic>.
Do steps 1-7 of WORKFLOW.md in order. Stop after step 2 and show me the script before you build.
```
````

Made by Web Lab. Follow **@weblabai** for one of these every day. The full build system (templates, tools and the Web Lab method) is inside Web Lab Academy.
